Granular-Ball Local-Consensus Soft Supervision for Noisy-Label Transductive Node Classification with Graph-Free Inference

Highlights

- Studies noisy-label transductive node classification with graph-free inference.
- GB-LCSS constructs granular balls in a label-free graph representation space.
- Leave-one-out local consensus provides node-specific soft supervision.
- Graph structure is used during training; inference uses node attributes only.
- GB-LCSS leads or ties in 24/25 settings against seven noisy-label MLP baselines.
